

IBM AI for Systems Engineering

Watson IoT™

Enrico Mancin
Lead Architect Europe
Watson IoT

About Today's Presenter

Enrico Mancin
(enrico.mancin@it.ibm.com)

Bio:

Enrico Mancin is the CE Tech Lead and IoT Lead Architect Europe IBM Watson IoT and the President of AISE INCOSE Italy Chapter.

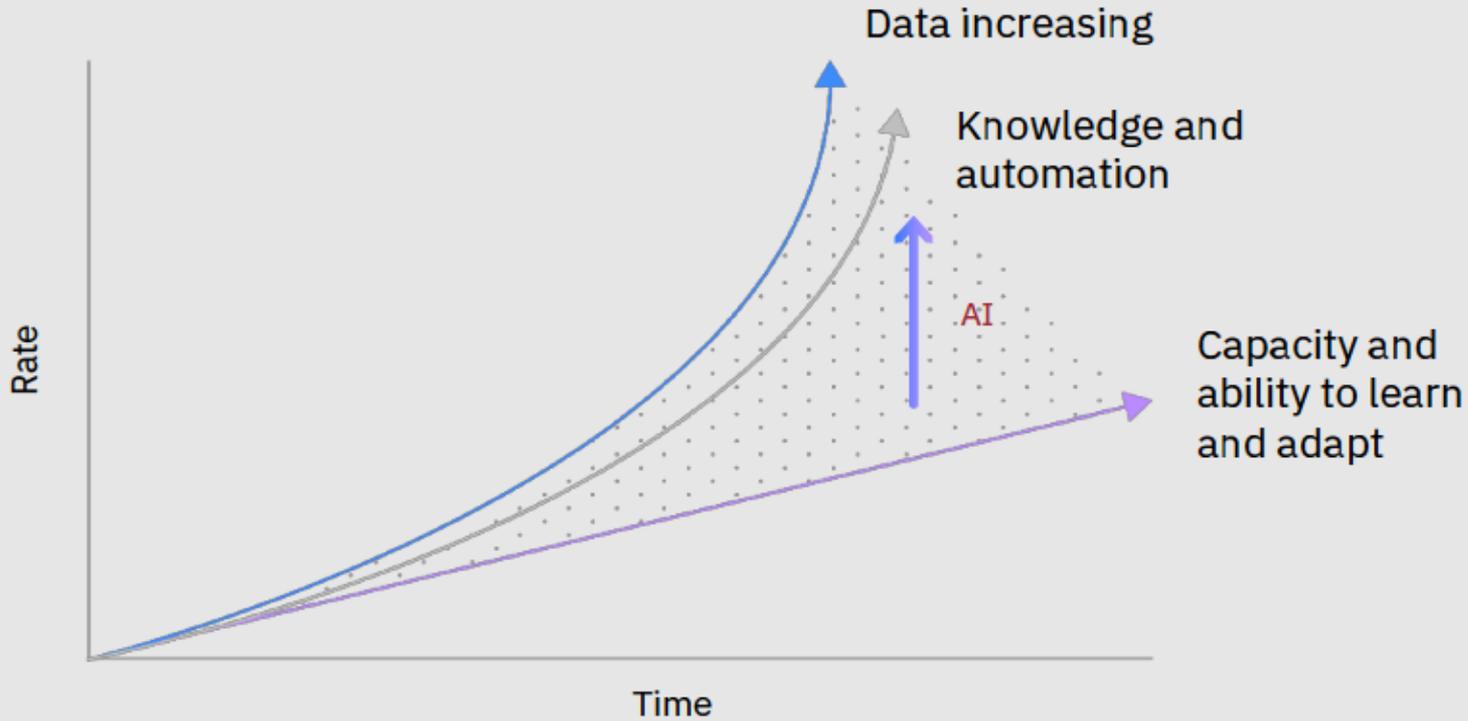

He is a former Business Solution Professional engineer first in the Industrial and then in the Public Sector of IBM Italy, where he was the lead systems engineer for some of IBM's development projects. On behalf of IBM, he has led client engagements in aerospace and defense, system development and IT enterprise architecture, helping clients transform their engineering organizations using IBM technologies, methods and tools.

He has been a practitioner, consultant, author and speaker on systems engineering and software development methods for 30 years. While an engineer, project manager, chief architect in important Italian companies, his experience spans in project management, systems engineering, architectural modeling and requirements analysis. His current specialization includes model-driven system development, enterprise architecture, estimation methods and solution architecture.

Agenda

- AI helps companies increase the capacity of their employees through automation and knowledge
- Engineering knowledge has become big data
- IBM's vision to inject automation and intelligence throughout the engineering lifecycle
- What we are doing today
 - Pre-training Watson
 - Released our first AI offering in requirements quality

AI accelerates our capacity to act by injecting knowledge and automation into business processes

One AI Example: Increasing Capacity through Knowledge at Woodside

Example of leveraging AI:

Working with Watson, Woodside Energy built a customized tool that allows its employees to find detailed answers to highly specific questions—even on remote oil and gas facilities.

- 38,000 Woodside documents were used to train the solution—this would take a human over five years to read
- 30 years of practical engineer experience at the fingertips of all Woodside employees
- 75% decrease in time employees spend searching for expert knowledge

We teach Watson to think like an engineer.

Watson teaches us to think like a thousand engineers.

One AI Example: Increasing Capacity through Automation at Autoglass

Example of leveraging AI:

Autoglass built the world's first automated vehicle body damage assessment and quote generation system. Using the IBM Watson Visual Recognition service, the system analyzes the photos that customers upload when they submit a body damage claim, applying the same classification logic as Belron's highly experienced damage assessment advisors.

- Shortens the claims cycle for certain damage assessments by more than 95%
- Enriches client experience through personalized conversation flows and real-time answers
- Enables damage assessment advisors to focus on more complex damage claims

- Shortens the claims cycle for certain damage assessments by more than 95%
- Enriches client experience through personalized conversation flows and real-time answers
- Enables damage assessment advisors to focus on more complex damage claims

"We're able to automate nearly half of our body damage claims assessments using image recognition technology, and we expect that rate to get even higher."

Dafydd Hughes
IT Manager at Autoglass Body Repair

Engineering knowledge has become big data... driven by the complexity of product development

Automotive

150M Lines of code in new Ford F-150 Truck from 155K in 2003

100x increase in test cases

40% of total IT Budget spent on QA and testing by 2019

Electronics

12M lines of code in mobile phone

1.4M lines of code in robotic surgical system

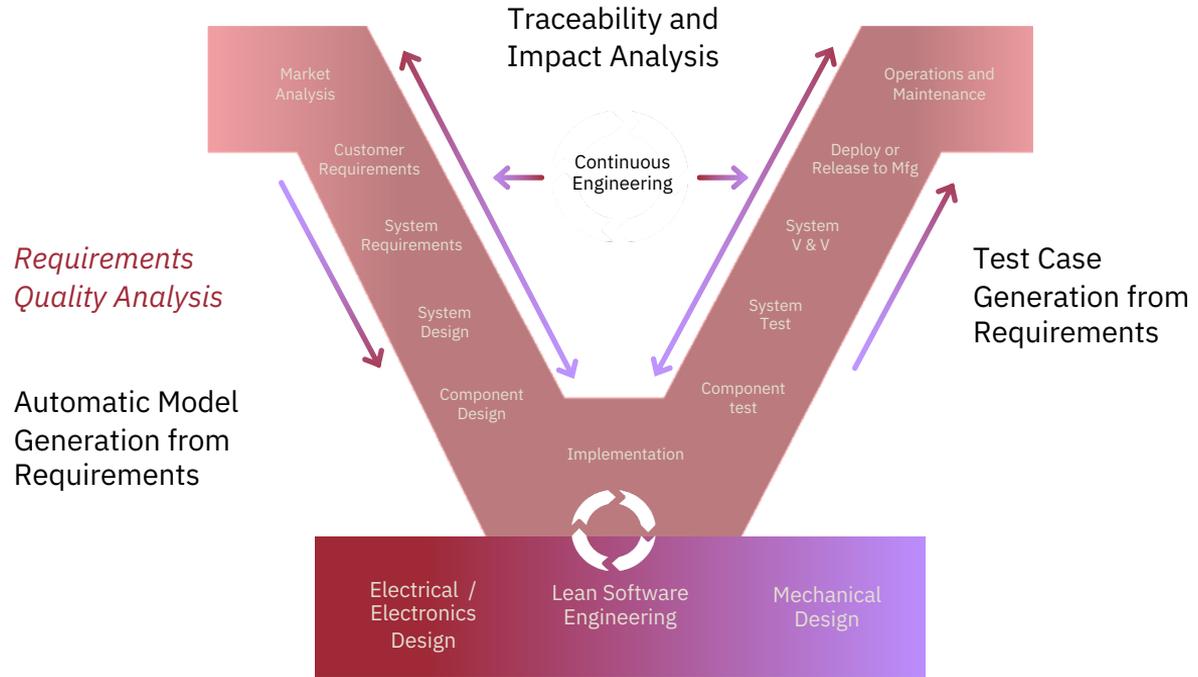

Aerospace and Defense

90% of F-35 fighter jet functionality is software driven

Optimize engineering with AI

Inject automation and intelligence across the engineering lifecycle

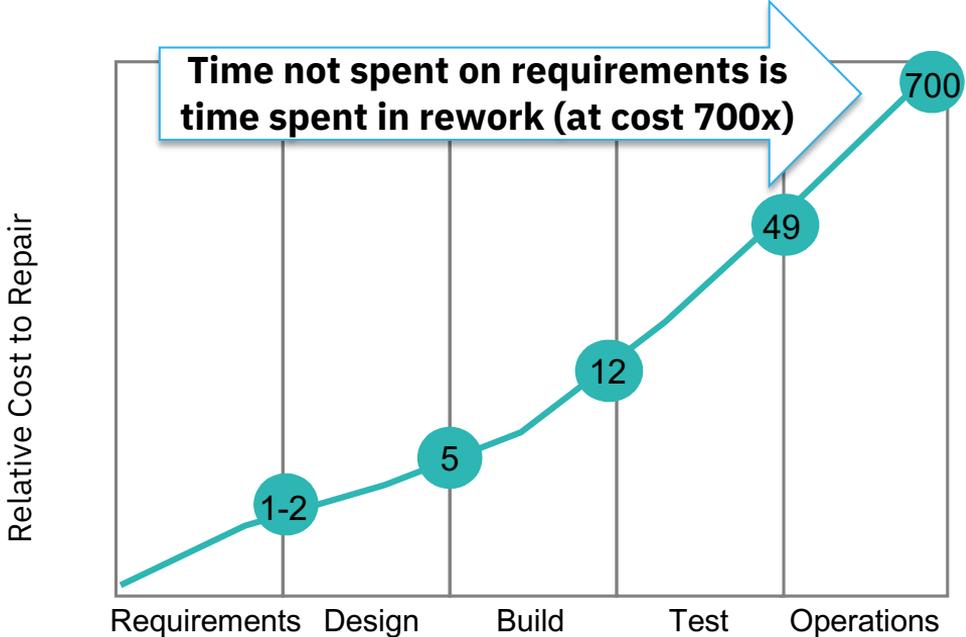

Companies with poor requirements management 3 project failures for every 1 success

Companies with poor requirements management, on average, spend \$2.24 million more per project

The cost to fix software defects rises exponentially with each successive phase of the project life cycle

Current solutions...and why they can miss errors

- **Rules engines**

- Simple key word searches cannot understand words in context
 - Ex. of “clear”
 - Ambiguous: “The GPS system shall provide a clear perspective of the road”
 - Not ambiguous: “The GPS System shall clear the display on transition to power off mode”

- **Peer review**

- Difficult to enforce across teams
- Manual, tedious review of long documents

- **Checklists**

- Limited capacity to keep track of all quality indicators (cognitive span is 7 +/- 2 things)

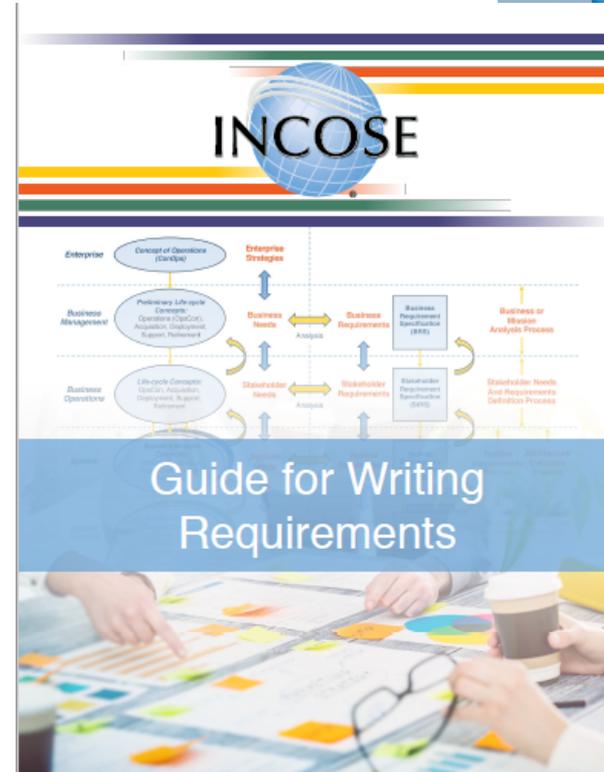

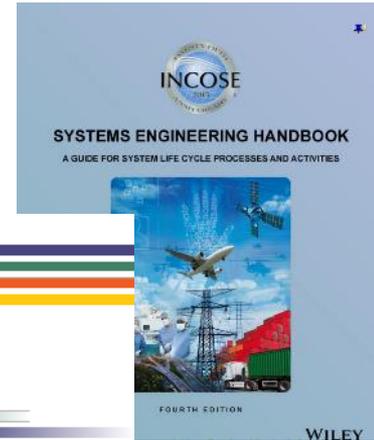

Best Practice Guidelines

INCOSE Guide for Writing Requirements

Written by a worldwide cross-industry team
Rules reflected in the Systems Engineering Handbook and ISO 15288

Some rules submit to a dictionary check

Some are more subtle

Types of Requirements

- **User Requirements** - define the results the users expect from the system

“The homeowner shall hear an alarm when smoke is detected”

- **System Requirements** - define what the system must do to satisfy the users

“The alarm shall produce a sound between 125-155 dBA”

- **Design Requirements** - define all of the components necessary to achieve the system requirements

“The alarm shall be produced by part # 123-45-678”

Writing a requirement

- Complete sentence
- States subject and predicate
 - Subject is a user type or the system under discussion
 - Predicate is a condition, action, or intended result.
- Consistent use of language
- Specifies:
 - desired goal or result (User requirement)
 - function (System requirement)
 - constraint (either)
- Contains a success criterion or other measurable indication of the quality.

Language

- Use consistent language, for example:
 - “Shall,” “will” or “must” are mandatory
 - “Should” is optional, but omission must be justified
 - “May” is desirable
- Use consistent terminology
 - Define terms – use a Glossary
 - Avoid using the same name for different things
 - Avoid using different names for the same thing

Anatomy of a Good User Requirement

Defines a user type

“To be” verb

“The internet user shall access their current account balance in less than 5 seconds.”

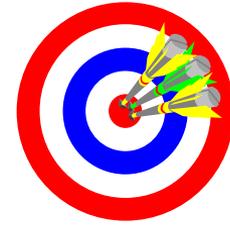

Defines a positive end result

Performance criteria

- This requirement sentence identifies a specific user and end result that is wanted within a specified time.
- It also defines the success criteria in measurable terms - “access ... account balance” “in less than 5 seconds.”

The challenge is to seek out the user type, end result, and success measure in every requirement you define.

Characteristics of a Good Requirement

Each individual requirement should be:

- Correct - Technically and legally possible
- Complete - Express a whole idea or statement
- Clear - Unambiguous and not confusing
- Consistent - Not in conflict with other requirements
- Verifiable - It can be determined that the system meets the requirement
- Traceable - Uniquely identified and can be tracked
- Feasible - Can be accomplished within cost and schedule
- Modular - Can be changed without excessive impact
- Design-Free - Does not pose a specific solution on design (i.e., implementation free)
- Positive - Written in the affirmative, not the negative

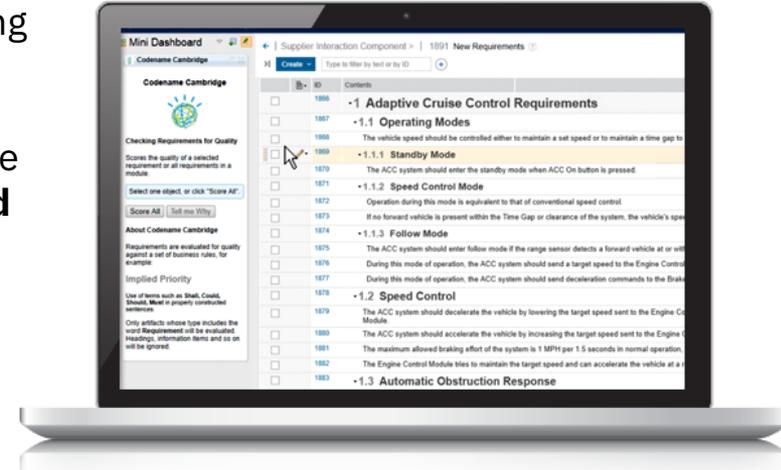

IBM Requirements Quality Assistant

New Watson capability embedded inside DOORS Next Generation (DNG)

- Removes risk and ambiguity in the requirements authoring phase out-of-the-box by using AI (Watson Natural Language Understanding)
- Pre-trained to detect key quality indicators designed to be consistent with the **INCOSE Guidelines for Writing Good Requirements**
- Authors receive coaching from Watson to improve the quality of the requirement as it is being written

Enterprise benefits (400 engineers example)

- Reduce the cost of defects by 60% to save \$3.9M
- Reduce cost of manual reviews by 25%
- Retain engineering expertise for junior engineers

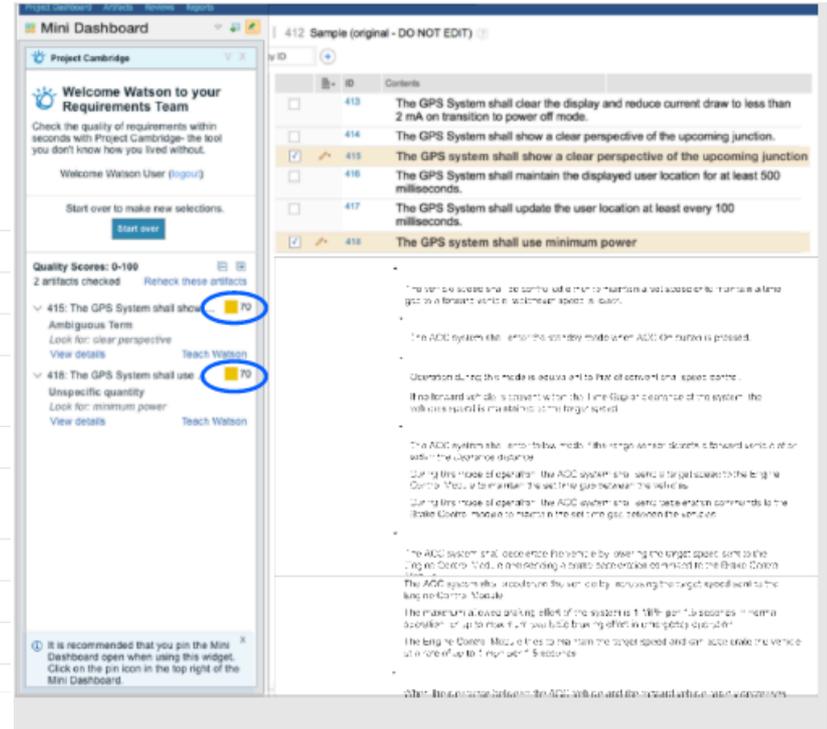

IBM Requirements Quality Assistant

- Grades requirements against a criteria that was designed to be consistent with the INCOSE Guidelines for Writing Good Requirements
- Pre-trained to detect 10 quality issues
 - Unclear actor or user
 - Compound requirement
 - Negative requirements
 - Escape clause
 - Missing units
 - Missing tolerances
 - Ambiguity
 - Passive
 - Incomplete requirements
 - Unspecific quantities

Table 1. Deductions for each issue

Issue	Deduction
Compound requirement	30
Escape clause	10
Incomplete: Missing action	30
Incomplete: Missing actor	30
Incomplete: Missing object	30
Missing imperative	30
Missing limits	20
Missing unit	20

- Add to the list of quality issues or do deeper training through a 3 week services engagement with IBM services team

IBM Requirements Quality Assistant

- Identifies exactly what's wrong with the requirement
- Displays the issue to the requirements engineer

The screenshot displays the IBM Requirements Quality Assistant interface. On the left, a 'Mini Dashboard' for 'Project Cambridge' shows a 'Welcome Watson to your Requirements Team' message and a 'Quality Scores: 0-100' section. Two requirements are listed with a score of 70: '415: The GPS System shall show ...' and '418: The GPS System shall use ...'. Both have circled issue descriptions: 'Look for: clear perspective' and 'Look for: minimum power'. On the right, a table lists requirements with their IDs and contents. Requirement 415 is highlighted, and its detailed issue description is shown below, including text about 'The vehicle speed shall be controlled to maintain a set speed or to maintain a target speed in a forward vehicle workload speed scenario' and 'The ADC system shall enter the standby mode when ADC throttle is closed'.

ID	Contents
413	The GPS System shall clear the display and reduce current draw to less than 2 mA on transition to power off mode.
414	The GPS System shall show a clear perspective of the upcoming junction.
415	The GPS system shall show a clear perspective of the upcoming junction
416	The GPS System shall maintain the displayed user location for at least 500 milliseconds.
417	The GPS System shall update the user location at least every 100 milliseconds.
418	The GPS system shall use minimum power

IBM Requirements Quality Assistant

- Learns from the requirements engineer
- Becomes “smarter” over time

The screenshot displays the IBM Requirements Quality Assistant interface. On the left is the 'Mini Dashboard' for 'Project Cambridge', which includes a welcome message, a 'Start over' button, and a 'Quality Scores' section showing '0-100' and '2 artifacts checked'. Two artifacts are listed: '415: The GPS System shall show ...' with a score of 70 and '418: The GPS System shall use ...' with a score of 70. A 'Teach Watson' button is circled in blue next to the first artifact. On the right is a table of artifacts with columns for 'ID' and 'Contents'. The table lists artifacts 413 through 418, with 415 and 418 highlighted in yellow. Below the table is a detailed view of artifact 415, showing its content and a 'Teach Watson' button.
